

# ***Heroes of CSS***

---

**The Coding Bootcamp**

# ***Admin Work***

---

# Homework Assignment

---

- **Also, at this point everyone should have access to the class repository in GitLab.**

<https://upenn.bootcampcontent.com/upenn-bootcamp/UPENN201901FSF5>

- **Homework Assignment #1 is Due:**

**2/9, Next Saturday**

# Homework Assignment

---

- **Really, work hard on this assignment!** This assignment introduces you to fundamental concepts that we'll be building the entire course-long.
- **Review In Class Material, *especially* Exercises:**  
<https://upenn.bootcampcontent.com/upenn-bootcamp/UPENN201901FSF5>
- **Work with your peers!** It's much better than screaming at your computer alone.
- **Ask Questions on Slack!** Your peers, TAs, and Instructors are all here to help when they can.

# Most Important of All....

**Just Submit SOMETHING** (even if it seems pretty crummy)!

***Warning!***

---

***Today is going to be a bit tough.***

***But trust us!***  
***It will all look easy a few weeks from now.***

***Don't expect to understand  
EVERYTHING at once.***

*Today is all about getting immersed.*

# ***CSS Recap***

---

***What is “CSS?”***

# HTML / CSS Definitions (\*yawn\* unimportant)

- **HTML:** Hypertext Markup Language – (Content)
- **CSS:** Cascading Style Sheets – (Appearance)
- **HTML/CSS are the “languages of the web.”** Together they define both the content and the aesthetics of a webpage – handling everything from the layouts, colors, fonts, and content placement. (JavaScript is the third – handling logic, animation, etc.)

# HTML / CSS Analogy

---

## HTML Alone

- Like writing papers in “Notepad.”
- Can only write unformatted text.

## HTML / CSS

- Like writing papers in Microsoft Word.
- Can format text, page settings, alignment, etc. based on “highlighting” and menu options.

# Basic HTML Page - Result

***How do we style HTML...***

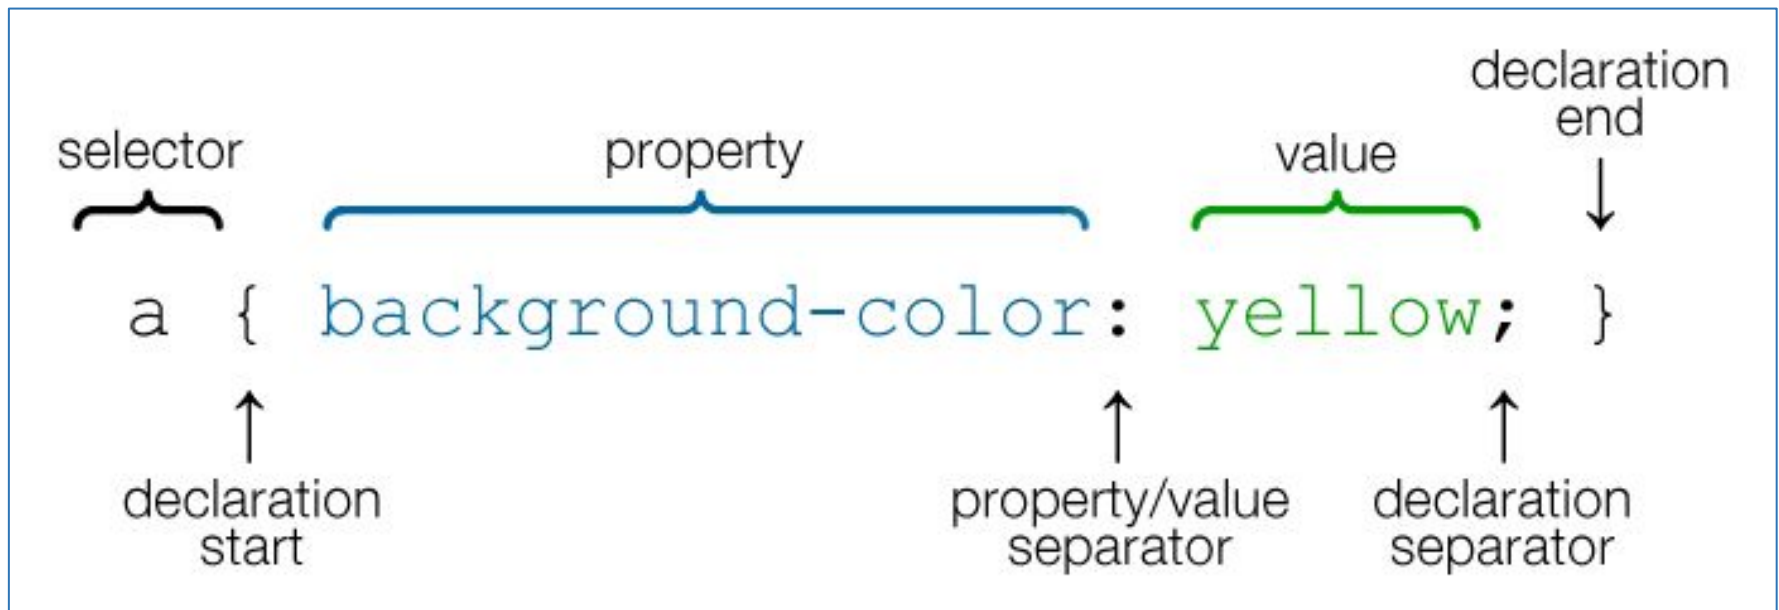

***Elements?***

***Classes?***

***IDs?***

# CSS Syntax

- CSS works by hooking onto **selectors** added into HTML using **classes** and **identifiers**.
- Classes use **.classname**, IDs use **#idname**, and elements use just their name.
- Once hooked, we apply **styles** to those HTML elements using CSS.

# Selectors

## Element selector

Applies to all <p> elements

Element name  
(p, a, div, span, etc)

```
p {  
  background-color: blue;  
}
```

## Class Selector

Applies to all elements with class="classItem"

Period (.) + variable name  
(.myDiv, .phoneNumber, etc.)

→ 

```
.classItem {  
  background-color: orange;  
}
```

## ID Selector

Applies to all elements with id="idItem"

Hash (#) + variable name  
(#myDiv, #phoneNumber)

→ 

```
#idItem {  
  background-color: green;  
}
```

# CSS Selectors

```
p {  
  background-color: blue;  
}
```

```
.classItem {  
  background-color: orange;  
}
```

```
#idItem {  
  background-color: green;  
}
```

+

```
<p>
```

A paragraph with a blue background.

```
</p>
```

```
<div class="classItem">
```

A div with an orange background.

```
</div>
```

```
<div id="idItem">
```

A div with a green background.

```
</div>
```

A paragraph with a blue background.

A div with an orange background.

A div with a green background.

***Questions so far?***

# ***Relative File Paths***

---

# Relative File Paths

```
1 <!DOCTYPE html>
2 <html>
3 <head>
4   <title>1.2.9 Exercise</title>
5
6   <!-- This critical line points your HTML to the CSS file. Notice the "relative" pathway -->
7   <link rel="stylesheet" type="text/css" href="style.css">
8 </head>
9 <body>
```

- **Relative file paths** connect us with other files in our working directory. In this case, `style.css` is in the same folder as our `html` document.

***Instructor: Demo***  
*(RelativePaths\_DEMO | 1-RelativePaths)*

# Absolutely No Absolute Paths

**VERY VERY BAD**

```
<!-- BAD!!!! -->  
<link rel="stylesheet" href="D:/trilogy/FullStack-Lesson-Plans/02-lesson-plans/01-  
html-css-three-days/1-Class-Content/1.3/Activities/1-RelativePaths/RelativePaths/  
RelativePaths_WorkingExample/style.css">
```

## ALWAYS USE RELATIVE FILE PATHS.

- If you deploy your sites without them, **all of your links will fail.**
  - The same will happen if you move your project from one folder to another.
- Remember, there is no such thing as a “C:” drive on the internet.

### Assignment

1. Unzip the folder sent to you via Slack.
2. Edit the HTML files in all of the “RelativePaths” folders. You need to write relative paths that link the HTML documents with CSS stylesheets.

Tip: Check out the “RelativePaths\_WorkingExample” folder.

# ***Box Model***

---

# Boxes Upon Boxes

**In CSS, every element rests within a series of boxes.**

Each box has customizable space properties:  
margin, border, and padding.

Typical spacing value: 20px 10px 10px 20px (top, right, bottom, left)

```
#box {  
  
    background-color: #1E5792;  
    width: 400px;  
    height: 440px;  
    margin: 10px 30px 20px 50px;  
    color: #fff;  
    padding: 25px 10px 30px 20px;  
    border-style: solid;  
    border-width: 22px;  
    border-color: #113152;  
  
}
```

**How wide is the blue #box?**

**How tall is the blue #box?**

**Total element width** = content width + left padding + right padding + left border + right border + left margin + right margin

**Total element height** = content height + top padding + bottom padding + top border + bottom border + top margin + bottom margin

## > YOUR TURN!!

```
#box {  
  
    background-color: #1E5792;  
    width: 400px;  
    height: 440px;  
    margin: 10px 30px 20px 50px;  
    color: #fff;  
    padding: 25px 10px 30px 20px;  
    border-style: solid;  
    border-width: 22px;  
    border-color: #113152;  
  
}
```

**How wide is the blue #box?**

**How tall is the blue #box?**

**Total element width** = content width + left padding + right padding + left border + right border + left margin + right margin

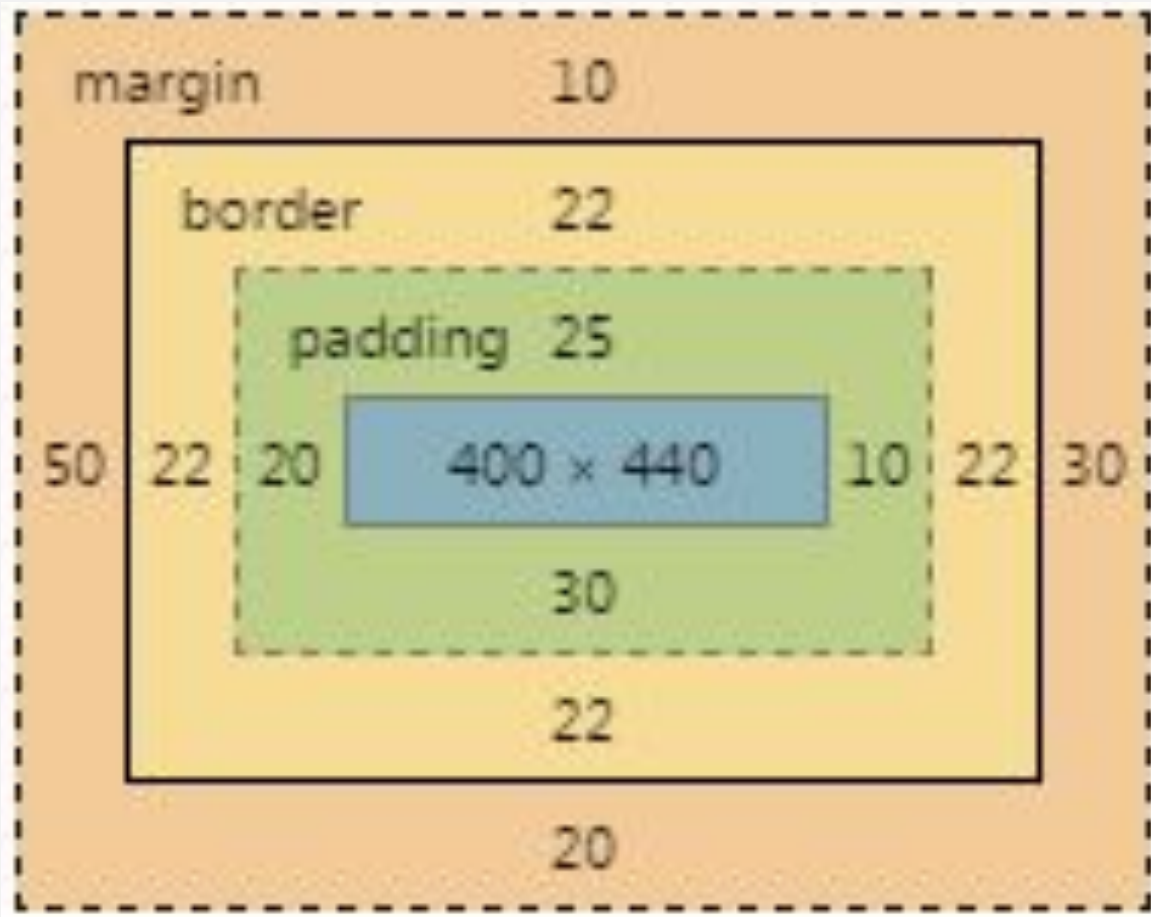

**Total element height** = content height + top padding + bottom padding + top border + bottom border + top margin + bottom margin

### Answer

**Width:** 474 px (no margin), 554 px (with margin)

**Height:** 539 px (no margin), 569 px (with margin)

## > YOUR TURN!!

### Answer

**Width:** 474 px (no margin), 554 px (with margin)

**Height:** 539 px (no margin), 569 px (with margin)

***We Be Floatin'***

---

# Take a Facebook Break...

## Warning!

These next topics are fairly “tricky”... but **VERY IMPORTANT.**

# The Concept of “Flow”

- By default, every HTML element displayed in the browser is governed by a concept called **flow**.
- This means that HTML elements force their adjacent elements to **flow around them**.

## Flow Analogy to MS Word

- This concept of “flow” is very similar to the **wrap-text options** you may be familiar with in Microsoft Word.
- Just as in MS Word, you can have images in-line with text, on-top of text, etc.

# Block Elements

- By default, web clients render many HTML elements as **block elements**. Paragraphs, headers, divs and more receive this treatment.
- A block element will take up an entire line of space—unless you intervene with CSS properties.

# Block Elements vs. Inline Elements

- Now contrast the block elements with **inline elements**.
- By using **float CSS** properties, we can command our website to display multiple HTML elements adjacently.

# Floating

## CSS

```
#sidebar {  
  float: left;  
}  
  
#main-content {  
  float: right;  
}
```

- To transform these block elements into inline elements, we use a CSS property called **float**.
- Floats are **necessary** for building web layouts.

# Clearing the Float

- **Floats often get in the way of our layouts.**
- Sometimes we don't want to give each element the "inline" treatment.

# Clearfix Hack

`<div>`

Uh oh... this image is taller than the element containing it, and it's floated, so it's overflowing outside of its container!

- Sometimes when elements don't match up in size, we get situations like the above...

# Clearfix Hack

```
<div class="clearfix">
```

Much better!

- We can get around this by using “the clearfix hack.”

# Clearfix Hack

```
.clearfix::after {  
  content: "";  
  display: block;  
  clear: both;  
}
```

- **::after** is what we call a pseudo-element. We use it to style specific parts of an element.
- This will add an HTML element, hidden from view, after the content of the “**.clearfix**” element. This clears the float.

# Fantastic Guide on Floats \*\*\*\*

## CSS-TRICKS

### All About Floats

CHRIS COYIER // JULY 8, 2009

#### What is "Float"?

**Float** is a CSS positioning property. To understand its purpose and origin, we can look to print design. In a print layout, images may be set into the page such that text wraps around them as needed. This is commonly and appropriately called "text wrap". Here is an example of that.

*Print Layout*

In page layout programs, the boxes that hold the text can be told to honor the text wrap, or to ignore it. Ignoring the text wrap will allow the words to flow right over the image like it wasn't even there. This is the difference between that image being part of the *flow* of the page (or not). Web design is very similar.

***BREAK!***

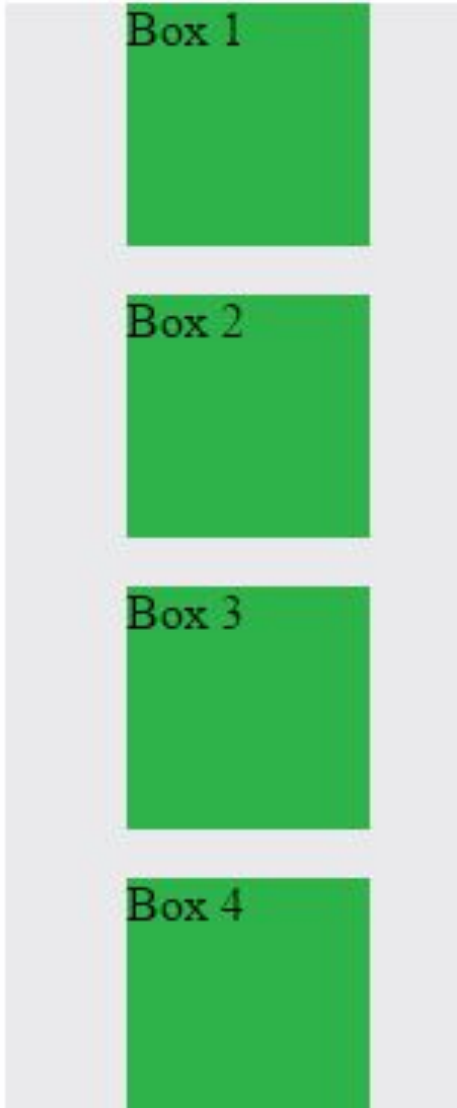

---

# ***CSS Positioning***

---

# Position: Static (Default)

---

- Four boxes placed statically (default)

# Position: Relative

- Switching the boxes to relative will nudge the boxes in relation to their “original” location.

```
.box {  
  background: #2db34a;  
  height: 80px;  
  position: relative;  
  width: 80px;  
}  
.box-1 {  
  top: 20px;  
}  
.box-2 {  
  left: 40px;  
}  
.box-3 {  
  bottom: -10px;  
  right: 20px;  
}
```

# Position: Absolute

```
.box-set {  
  height: 400px;  
  background: darkgray;  
  position: relative;  
}  
.box {  
  position: absolute;  
  height: 150px;  
  width: 150px;  
  background: #2db34a;  
  border: 2px solid black;  
}  
.box-1 {  
  top: 6%;  
  left: 2%;  
}  
.box-2 {  
  top: 0;  
  right: -40px;  
}  
.box-3 {  
  bottom: -10px;  
  right: 20px;  
}  
.box-4 {  
  bottom: 0;  
}
```

Positioned relative to nearest positioned ancestor

# Position: Fixed

```
.box-set {  
  height: 400px;  
  background: darkgray;  
}  
.box {  
  position: fixed;  
  height: 150px;  
  width: 150px;  
  background: #2db34a;  
  border: 2px solid black;  
}  
.box-1 {  
  top: 6%;  
  left: 2%;  
}  
.box-2 {  
  top: 0;  
  right: -40px;  
}  
.box-3 {  
  bottom: -10px;  
  right: 20px;  
}  
.box-4 {  
  bottom: 0;  
}
```

Position with exact coordinates to the browser window

# Layering with Z-Index

**position: absolute;  
z-index: 1;**

**position: absolute;  
z-index: 2;**

- **Z-Index allows you to layer elements on top of each other when they're positioned.**

# Hiding Things

- “Display: none” allows us to hide elements from view.
- This will become useful in later sections, when we’ll be hiding and revealing specific HTML elements of our choice.

## Lesson 5

# Positioning Content

One of the best things about CSS is that it gives us the ability to position content and elements on a page in nearly any imaginable way, bringing structure to our designs and helping make content more digestible.

There are a few different types of positioning within CSS, and each has its own application. In this chapter we're going to take a look at a few different use cases—creating reusable layouts and uniquely positioning one-off elements—and describe a few ways to go about each.

## Positioning with Floats

One way to position elements on a page is with the `float` property. The `float` property is pretty versatile and can be used in a number of different ways.

Essentially, the `float` property allows us to take an element, remove it from the normal flow of a page, and [position it](#) to the left or right of its parent element. All other

# Advice

**Re-do this at home.**

*We designed this exercise to firm up your HTML/CSS skills.*

**REMEMBER:**

*The best way to learn web development is to PRACTICE!*

# ***Chrome Inspector***

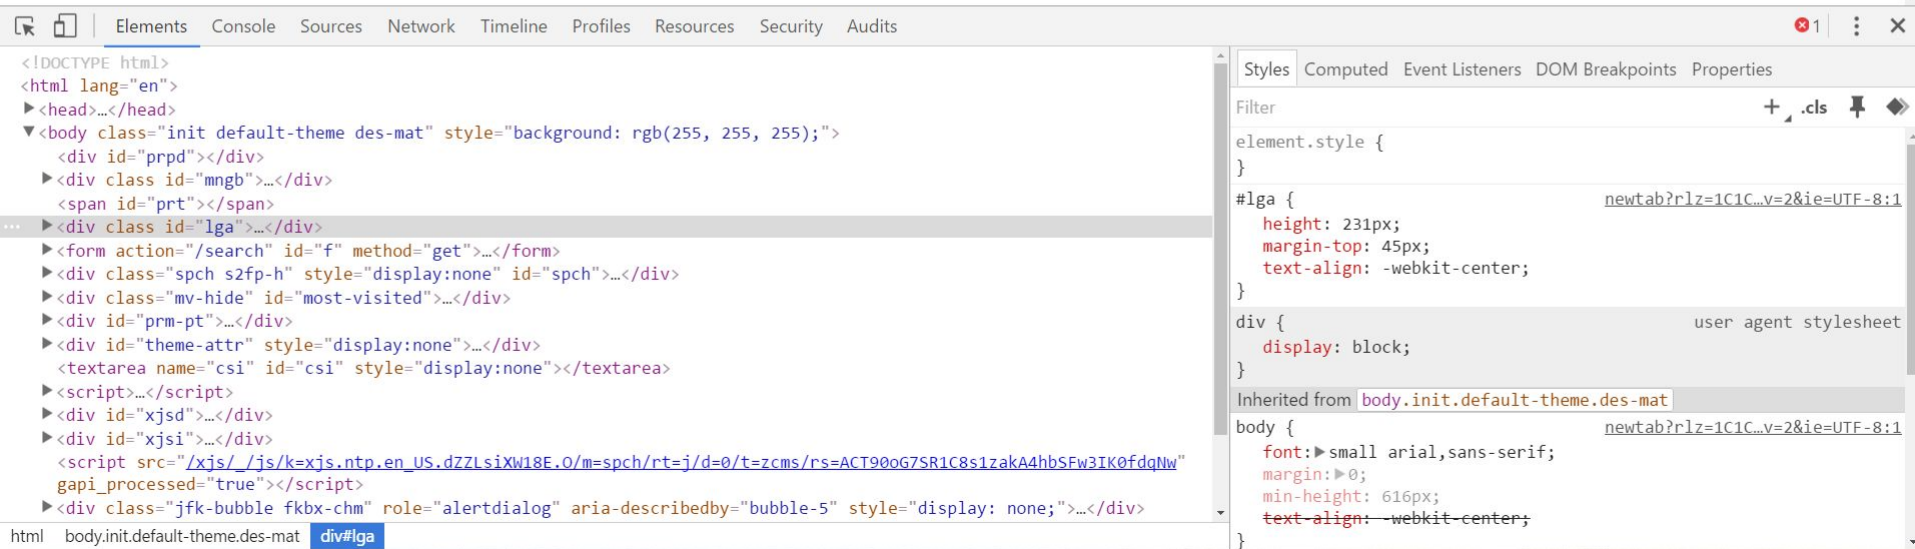

---

# Chrome Inspector is Your Friend

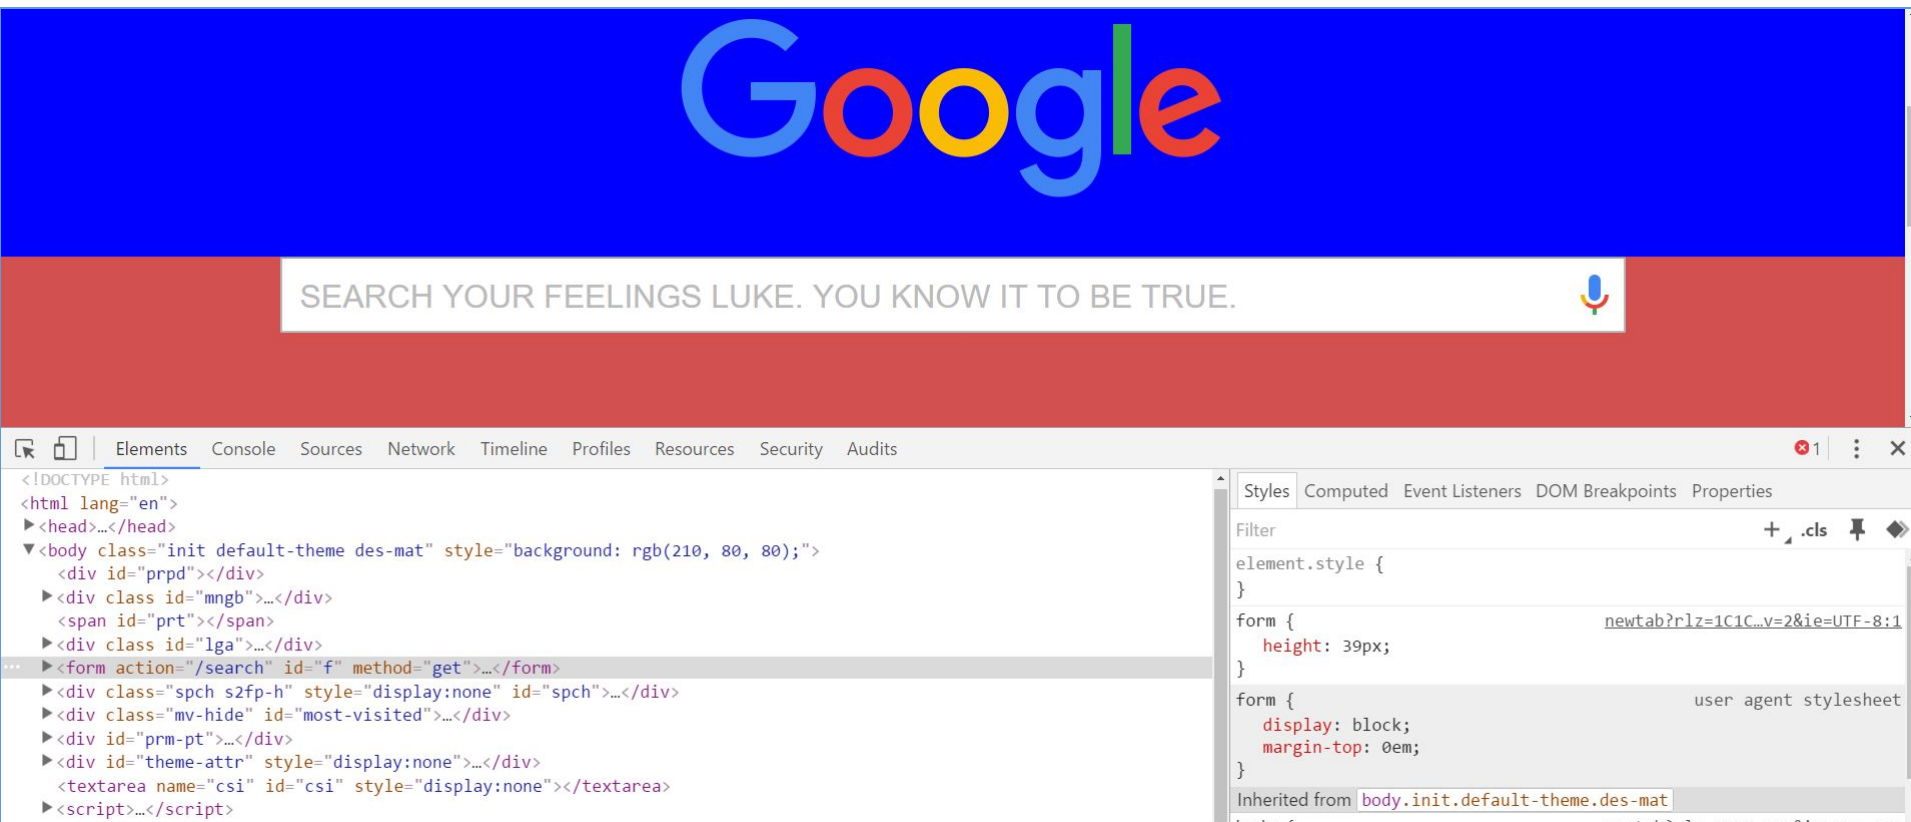

Search Google or type URL

- To access chrome inspector, right click on a page. Then hit “Inspect.”
- It will allow you to inspect the HTML, CSS and more!

# Chrome Inspector is Your Friend

- You can even edit the HTML/CSS of a webpage and instantly view your changes in the browser!
- This works on any website, whether yours or not.

## Next Class!

---

***We'll be coming back to this  
in our next class.***

# ***Recap + Reassurances***

---

You  
got  
this

***Questions?***

---

***EXTRA MATERIAL***

---

# > YOUR TURN!!

---

## Assignment

Take a website you commonly visit (Amazon, Google, Huff Po, etc.) and heavily modify it with Google Developer Tools.

You have 15 minutes to test Chrome Inspector. Try modifying:

- Content (change words).
- Colors.
- Spacing.
- Any other CSS style rules.

When you're done, send a screenshot to your class's Slack.

# ***CSS Resets***

---

# Loading Multiple CSS Files **\*\*\* (Very Important!!!) \*\*\***

```
1  <!DOCTYPE html>
2  <html>
3  ▼ <head>
4      <title>Multiple CSS Files!!</title>
5      <link rel="stylesheet" href="assets/style1.css">
6      <link rel="stylesheet" href="assets/style2.css">
7      <link rel="stylesheet" href="assets/style3.css">
8  </head>
9  ▼ <body>
10 ▼   <header>
```

- We can link our documents to more than one stylesheet at a time—one of the most powerful features of CSS/HTML.
- By tapping into different stylesheets simultaneously, we can create complex layouts with plenty of design rules.
- Just remember: the loading **order matters!!!**

# What Browser?

---

*By a show of hands...*

***Which browser do you use?***

# Battle of the Browsers

- Under the hood, web browsers often **render webpages differently** than their competition.
- These disparities could mean HTML/CSS displaying differently in each web client.
- Because of these potential divergences, web developers need to make their websites **cross-browser compatible**.

# Reset.css (or Normalize.css)

- Reset.css will “reset” all browser-specific CSS. This means your site will appear the same in all browsers.
- However, you will have to re-style everything yourself.

# Why CSS Resets Matter

---

1. It's important for creating browser-compatible websites.
2. It's an example of using someone else's CSS in your website!!!
3. It's a common Front-End Developer Interview question.

# > YOUR TURN!!

---

## Assignment

Follow the instructions given via Slack to incorporate a `reset.css` file in a basic HTML file.

Note the impact of the reset file makes after you include it.
